

*Semi-automatic crack detection of  
**cylinder liners**  
in engine block  
with **2-channel eddydetector®***

*Versatile test system for engine blocks with 3, 4 and 6 cylinders in line as well as of 6-, 8- and 12-cylinder V-engine blocks*

*The compact test system can be moved quickly from the laboratory to the production site.  
Automatic test systems can directly be integrated into the engine production process.*

*The rotating probe is introduced automatically into the cylindrical borehole and scans the whole surface for cracks and pores.*

*By means of the xy slide tolerances in the position and angle of the cylindrical boreholes are automatically compensated.*

*The ball-bearing probe guidance centres the above-positioned test probe exactly in the cylinder borehole.*
